

Deep Learning CIFAR-10 Project Description:

- CIFAR-10 is an image classification project where a model learns to identify 10 different object categories from small images.
- It uses 60,000 labeled images, making it a standard dataset for testing deep learning models.
- The goal is to train a **Convolutional Neural Network (CNN)** to accurately predict the class of unseen images.
- This project helps understand image processing, feature extraction, and model performance comparison.
- It is widely used to show how deep learning performs better than traditional machine learning on image data. 🚀
